

Vena for Sage Intacct

Bring the cloud down to earth - break down data silos by seamlessly integrating Sage Intacct with Vena. Our direct integration with Sage Intacct allows you to get timely access to your data in Vena so you can spend less time manually manipulating data and more time telling the story behind your numbers.

KEY FEATURES

- **Gain confidence in your numbers.** Accelerate time-consuming data integration tasks and gain data integrity by eliminating errors that often occur with manual data manipulation so you can get trusted insights—fast.
- **Get back lost time.** Our fast and secure web-based interface lets you automatically load your data into Vena with ease.

- **Stay in the know.** Alerts and notifications on the status and progress of data loads into Vena mean you'll never have to guess if an integration was a success.
- **Say goodbye to rigidity and hello to flexibility.** You can tailor the Sage Intacct and Vena integration to synchronize relevant relationships, data and hierarchies.

HOW DOES IT WORK?

Setting up your Sage Intacct connection is a streamlined, web-based process run through Vena. Once the login credentials are entered, the connection is set up within seconds.

HOW VENA PARTNERS WITH YOU

Vena works with your team to configure your data integration, validate your data and provide best practices throughout the process.

We will work with your team to:

- Review Vena and Sage Intacct integration requirements
- Configure the Vena Sage Intacct connector
- Load data into Vena
- Guide you through best practices to validate source data

How You Can Work With Us:

- Provide a resource with knowledge and understanding of Sage Intacct who can identify objects and tables required for integration and provide queries to bring over the required data
- Provide necessary Sage Intacct access and permissions
- Validate completeness and integrity of data

STANDARD INTEGRATION FIELDS AND OBJECTS

Through our direct connection, Vena is able to query any of the objects found on the Sage Intacct Developer website.

The most common objects that will be queried include the GL Transactions object (GLDETAIL) and the Opening Balance object (GLACCOUNTBALANCE). The former contains the data with all the details that are entered when you are making journal entries and the latter contains opening balances that enable us to balance the balance sheet.

ADDITIONAL DETAILS

- The Sage Intacct native connector into Vena is built with readyByQuery and queries directly against Sage Intacct APIs
- Integration will require read permissions to the above standard objects in Sage Intacct
- Transformations to the incoming Sage Intacct data will be handled in Vena (i.e. aggregation, normalization, simple mappings, etc.).
